A new competition run by two cutting-edge medical research units in Leicester is challenging local photographers to take pictures that help change science in the community.

The initiative, led by the University of Leicester, aims to showcase local talent and get people thinking about science. The competition challenges budding shutterbugs to submit images by 30th June. Each lecture will start at 6:30pm. Each lecture will last 1-2 hours. Refreshments are available from www.lboro.ac.uk/about/findus.html. Full directions are available on: Loughborough University, LE11 3TU Theatre, HE0.10, Clyde Williams Building, Leicester, LE1 7EP.
Diabetes is a long-term condition that affects the body’s ability to process sugar or glucose. It can have serious health consequences. People with diabetes are at greater risk of heart disease, stroke and other complications, such as retinopathy, which can lead to blindness, and neuropathy, which can lead to amputations. It is a serious illness. One in 10 people will have the condition. It is usually managed through diet and exercise, and people with diabetes need to lead a healthy and active life, but have to look after themselves very carefully.

The research will compare effectiveness at whether we can reverse diabetes. Much research to date has focussed to amputations. It is a serious illness. 1 in 10 people will have the condition. It is usually managed through diet and exercise, and people with diabetes need to lead a healthy and active life, but have to look after themselves very carefully.
