Neuroorganization —
an ontology of organization

Abstract

How did global capitalism get its networks and circuits? Could it be that today's social organization is linked to how the brain 'works'? Every epoch has its brain. Today's brain is believed to be extended and networked. This was, of course, not always the case. So, what if the way we believe our brain is organized has material effects on the ways our bodies and social life are organized which again feeds back into the composition of the brain? And what if the idea of the organizational brain is not just another metaphor in organizational theory but an ontology in the making?
